SUMMARY

Systems-focused software engineer. I design APIs, data models and the interfaces on top of them, build end to end on the stack that fits, and keep what I ship running in production. Ranked first in my Software Engineering diploma cohort (90.36%).

EXPERIENCE

Full-Stack Software Engineer — Qader
E-Learning Platform — 2025 - Present

- Build REST APIs in Django and DRF, with live features over WebSockets and slow jobs on Celery workers.
- Develop the Next.js and TypeScript web app: Arabic first, right-to-left layouts, English as the second language.
- Ship through Docker, Nginx and GitHub Actions CI, and monitor production with Prometheus and Grafana.

Full-Stack Developer — Khamsat
Freelance — Aug 2024 - Present

- Build and deploy full-stack web apps for clients: e-commerce stores, learning management systems and company websites.
- Pick the stack per project, mostly Django (DRF) and Next.js, and design the REST APIs and databases behind each one.
- Run deployment end to end on VPS servers, from server setup to production release.

PROJECTS

Max CLI: Developer Terminal Tool — Project Link
Technologies Used: Python, Typer, FFmpeg, Pytest, Ruff, GitHub Actions, PyPI

- Published an open-source CLI to PyPI with 21 commands for video, audio, PDF, image and file tasks, plus drop-in plugins.
- Added an undo log for file operations, and CI that tests 3 operating systems across 4 Python versions (12 jobs).

NanoManga Studio: AI Manga Creation (Hackathon) — Website Link | Project Link
Technologies Used: Next.js, TypeScript, Tailwind CSS, Shadcn/ui, Google Gemini API (text and image models)

- Built for Google's Nano Banana hackathon: turns a one-line idea into finished, downloadable manga pages.
- Kept characters consistent by sending earlier pages and character sheets back to the image model with each new page.

School Management System — Project Link
Technologies Used: C#, Windows Forms, Oracle Database, SQL

- Desktop app for school records across 24 forms: students, staff, classes, grades and weekly schedules.
- Routed every query through one database gateway with parameterized SQL, so no form opens its own connection.

Ghosn (غصن): AI Smart Farming Platform (Hackathon) — Website Link | Project Link
Technologies Used: React, Material-UI, JavaScript, Axios, Vite, .NET

- Built the React frontend: a multi-step form for farm data and a page with each farmer's cultivation plan.
- Connected it to the .NET REST API, with live chat, right-to-left Arabic support and a leaderboard.

EDUCATION

Aleppo University, B.Sc. Information Technology Engineering — Dec 2023 - Present
Syrian Virtual University, B.Sc. Information Technology Engineering — Oct 2021 - Present
Software Engineering Diploma, ranked 1st in cohort (90.36%) — Sep 2021 - Jun 2023

CERTIFICATIONS

Meta: Android Developer 2026 · Database Engineer 2025 · Back-End Developer 2025 · Front-End Developer 2024
Other: Odoo Developer, EBTECH 2024 · Django for Everybody, University of Michigan 2024

TECHNICAL SKILLS

Front-End: Next.js, React.js, TypeScript, JavaScript, TanStack Query, Zustand, Redux Toolkit, Shadcn UI, Material UI
Mobile: Kotlin, Android SDK, Android Jetpack, Android Studio
Back-End: Django, Django REST Framework (DRF), OpenAPI (Spectacular), Python, Node.js, .NET, C#, PHP
Databases & Caching: PostgreSQL, MySQL, SQL Server, Oracle, Redis
DevOps & Tools: Docker, Git, GitHub, Linux, Nginx, VPS, CI/CD, Celery, WebSockets, Pytest, Figma
Languages: Arabic (native), English (C1)
